

## Green Stormwater Infrastructure Facility

Our proposed project intends to improve an otherwise unused portion of land with the creation of a **Class I trail**, expanding pedestrian access for residents of the adjacent neighborhood to the BART station. Bioretention pockets will also be included to filter roadway runoff through vegetation; trees and other plants will be installed to help mitigate for heat island effects. This project has been identified in the City's Green Stormwater infrastructure plan and the City's Capital Improvement Program and is roughly estimated at **\$1.5 million**.
